

CUPSS Community Calls

*To facilitate discussions on
asset management implementation*

What is Water System Asset Management?

Asset management is a framework that helps water systems make informed decisions about the management of their water infrastructure. Going through an asset management process gives systems a documented understanding of the assets they have, how long they are going to last, and how much it's going to cost to repair, rehabilitate or replace them. The main asset management practices include:

- Building an inventory of assets,
- Scheduling and tracking maintenance tasks through work orders, and
- Managing budgeted and actual annual expenses and revenue.

How does CUPSS fit into Asset Management?

The Check Up Program for Small Systems (CUPSS), first released in 2008, is a desktop software that smaller water and wastewater systems can use to implement their asset management practices.

What's the purpose of these calls?

The CUPSS Community Conference Call is a forum for those using, training, and learning about CUPSS to hear updates and implementation strategies from CUPSS practitioners.

Join us in the quarterly CUPSS Community Calls

Thursday, January 31, 2013

Tuesday, April 30, 2013

Wednesday, July 31, 2013

Thursday, October 31, 2013

All calls are from

2:00-3:00pm ET

Register for the January 31st call at:
